

Introduction to PID control scheme

e-Yantra Team

Indian Institute of Technology, Bombay

February 15, 2024

Agenda for Discussion

- 1 Control Systems Terminologies
- 2 Plant Input and System Responses
 - Type of Inputs
 - System response
- 3 PID
 - What is PID?
 - Proportional Controller - P
 - Proportional Controller - PI
 - Proportional Integral Derivative controller - PID
- 4 PID Control of SBR
- 5 PID tuning Procedure

Outline

- 1 Control Systems Terminologies
- 2 Plant Input and System Responses
 - Type of Inputs
 - System response
- 3 PID
 - What is PID?
 - Proportional Controller - P
 - Proportional Controller - PI
 - Proportional Integral Derivative controller - PID
- 4 PID Control of SBR
- 5 PID tuning Procedure

Terminology

- Systems can be classified as open-loop systems and closed-loop systems
- Open loop systems can be termed as uncontrolled systems.No feedback involved
- Closed loop system has a feedback and can be termed as control system

Terminology (Contd.)

Plant : The part or component of a system that is required to be controlled.

Controller : The part or component of a system that controls the plant.

Feedback : A measure of the output of the system used for feedback to control

Error : Error is the difference between desired value and measured process value

Outline

- 1 Control Systems Terminologies

 - Type of Inputs
 - System response
- 3 PID
 - What is PID?
 - Proportional Controller - P
 - Proportional Controller - PI
 - Proportional Integral Derivative controller - PID
- 4 PID Control of SBR
- 5 PID tuning Procedure

Type of Inputs

Figure: Impulse Input

Figure: Step Input

System response

Step Response : It is how a system responds to step input.

System response

Referred a video on MATLAB Tech Talk by Brain Douglas: Step Response

Outline

- 1 Control Systems Terminologies
- 2 Plant Input and System Responses
 - Type of Inputs
 - System response
- 3 PID
 - What is PID?
 - Proportional Controller - P
 - Proportional Controller - PI
 - Proportional Integral Derivative controller - PID
- 4 PID Control of SBR
- 5 PID tuning Procedure

What is PID?

- PID stands for Proportional Integral Derivative controller.
- Error based controller.
- Output of controller is the a linear function of constants and errors
- Advantages : Easy to implement, no information about dynamic model of the system required, robust, widely used in industry.
- Disadvantages : Tuning of parameters, sometimes cannot work for all conditions in complex non linear systems

Proportional Controller

- Output is proportional to the error

$$\text{Output} = K_p \cdot \text{error}$$

Proportional Controller -P

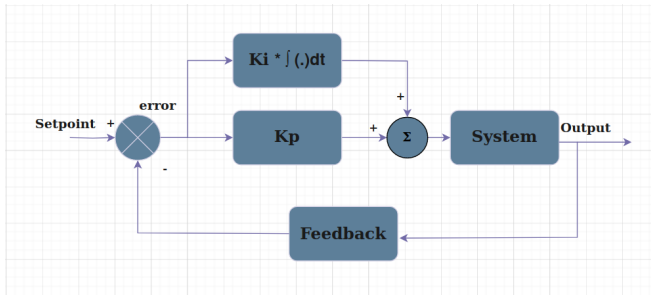

- 1 Increase in K_p decreases rise time.
- 2 Adds oscillations in the system.
- 3 Decreases steady state error.

Proportional Controller - PI

Output is the sum of the proportional and integral term:

$$\text{Output} = K_p \cdot \text{error} + K_i \cdot \int \text{error} dt$$

Proportional Controller - PI

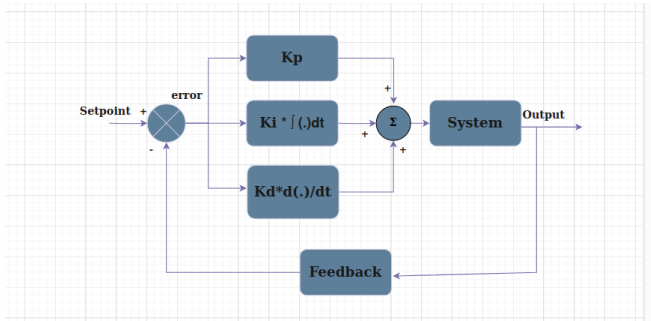

- 1 Addition of I term reduces steady state error
- 2 Also increases oscillations
- 3 Can lead to integral windup problems

Proportional Integral Derivative controller - PID

Output is the sum of proportional, integral, and derivative terms:

$$\text{Output} = K_p \cdot \text{error} + K_i \cdot \int \text{error} dt + K_d \cdot \frac{d(\text{error})}{dt}$$

Proportional Integral Derivative controller - PID

Combines features of P, I and D

Faster rise time, minimal oscillations, zero steady state error

Outline

- 1 Control Systems Terminologies

 - Proportional Controller - PI
 - Proportional Integral Derivative controller - PID
- 4 PID Control of SBR
- 5 PID tuning Procedure

PID Control of SBR

■ **Objective:** To balance the SBR.

■ **Steps:**

- 1 Step 1: Calculate the error: $error = desired_angle - current_angle$.
- 2 Step 2: Calculate the differential of the error:
 $difference_error = error - prev_error$.
- 3 Step 3: Calculate the sum of the error:
 $sum_error = sum_error + error$.
- 4 Step 4: Calculate the PWM output:

$$PWM_output = K_p \times error + K_d \times difference_error + K_i \times sum_error$$

Outline

- 1 Control Systems Terminologies
- 2 Plant Input and System Responses
 - Type of Inputs
 - System response
- 3 PID
 - What is PID?
 - Proportional Controller - P
 - Proportional Controller - PI
 - Proportional Integral Derivative controller - PID
- 4 PID Control of SBR
- 5 PID tuning Procedure

PID tuning Procedure

Objective: To balance the SBR.

- Start with K_p , K_d , $K_i = 0$.
- Increase K_p until sustained oscillations are achieved.
- Increase K_d to dampen oscillations.
- Add K_i to remove steady-state error.
- Fine-tune K_p , K_d , K_i to achieve desired performance.

Let's tune through Simulation

Thank You!
